

Thank you for purchasing our **K8 Lawn Plant Food (15-5-10/1Mg/15S/.05Cu/.5Fe/.05Mn/.5Zn)**

This custom home formula has all the nutrients needed for a top quality home lawn. Note: Even though this is a lawn fertilizer K8 can also be used on gardens, trees, shrubs and flowerbeds.

Listed below are general guidelines for using our K-8 15-5-10 Lawn Fertilizer.

1 Cup = 0.5 Lbs. 1 Quart = 2 Lbs. 1 Gallon = 8 Lbs.

ESTABLISHED LAWN: apply just prior to spring green up **10 lbs per 1000 square feet.** Topdress and water in 7 lbs per 1000 square feet every 8 weeks as needed during the growing season. To avoid fertilizer burn, never apply the fertilizer to wet grass and always water in after the application. The middle spreader setting on most spreaders is calibrated at 8-10 lbs. per 1000 square feet.

GARDEN: In the spring apply and incorporate just before planting 15 lbs per 1000 square feet of K8 Lawn Fertilizer. Topdress and water in another 5-7 lbs per 1000 square feet of K8 Lawn Fertilizer four to five weeks later on high nitrogen crops such as corn, potatoes, and onions. However, **do not** topdress your tomatoes, squash, watermelons, and especially beans.

FLOWERS: Apply 1 pound per 100 square feet (10 X 10 feet) and work well into soil before planting. Apply an additional 1 pound per 100 square feet every 12 weeks, mixing lightly with topsoil, making sure not to disturb the roots. Water thoroughly after each fertilizer application.

SHRUBS AND HEDGES: Apply in the spring, after danger of a killing frost is past, 1 pound per 100 square feet (10 X 10 feet) and work lightly into the soil, making sure not to disturb the roots. Water thoroughly after application. Repeat this application in early summer.

SHADE TREES and/or FRUIT AND NUT TREES: For an under the tree limb surface fertilizer application, apply 1 pound per inch of the trunk's diameter. Measure the trunk diameter five feet from the ground. Apply this fertilizer rate in early spring and again in late summer. However, fertilizer is more available to tree roots when applied deep in soil. For this method of application make holes with a crow bar or some pointed object at three-foot intervals in a ring around the tree at the edge of the branches and apply 1/2 cup of fertilizer per hole. With this deep fertilizer application, apply fertilizer in early spring and again in late summer.
